

How to set project directory path

In future lectures we will be using this command:

"export PYTHONPATH=\$PYTHONPATH:."

This command is only needed for Mac system.

If you are working on Windows, please follow this:

Navigate to the project directory. Not to the package where the code is, just to go project directory on terminal using **cd** command.

Then you can use this command:

set PYTHONPATH=%PYTHONPATH%;C:\Complete path of the directory from where you are running the code

If the above does not work, please try these also:

set PYTHONPATH=%PYTHONPATH%:. (The last dot is included in the command, it represents current directory)

Alternatively, you can do this:

You can add the directory where your project is located to the Windows PATH environment variable.

You can follow the steps shown in lecture "Selenium WebDriver 3.x Gecko Driver Setup - Windows" to see how we add a new path to PATH environment variable.

You can also follow this article for more understanding:
